FINAL NICHE LOCK

Germany Tool-Based SEO Micro-Niche

Final decision on domain, niche scope and launch tools

Decision status	**LOCK**
Primary domain	**lademeter-rechner.de**
Locked micro-niche	**LKW Ladeplanung, Lademeter & Palettenberechnung**
Target market	Germany / German-language search
Launch scope	4 tightly related browser tools + supporting SEO content

Domain availability note: The domain is the recommended purchase target. Current search found no indexed site for the exact domain, but search indexing is not proof of registration availability. Confirm availability directly with DENIC or your registrar immediately before purchase.

Bottom line: Lock the project around German truck-loading space planning, with Lademeter as the primary acquisition keyword and pallet/carton loading as the supporting tool cluster. Do not broaden into a generic logistics-calculator site.

1. Why this is the final choice

The final choice is based on two layers of validation: current German SERP research and the Ubersuggest data you supplied for Germany / German. The strongest signal is the combination of a sizable head keyword, multiple supporting queries, commercial CPC signals, and a result landscape where specialist sites and tool pages can still compete.

Validated keyword	Volume	CPC	SEO Difficulty
Lademeter berechnen	2,400	EUR 1.28	25
Lademeter Rechner	480	EUR 1.41	31
wie viele Paletten passen in einen LKW	390	EUR 1.95	7
wie viele Europaletten passen in einen LKW	210	EUR 2.07	7
Palettenrechner	90	EUR 3.32	47
Lademeter Europalette	70	EUR 2.47	25

Important: The 20 checked logistics keywords sum to about 3,850 reported monthly searches. This is a keyword-volume sum, not a forecast of 3,850 unique visits; keyword intent overlaps. Excluding the 2,400-volume head term still leaves about 1,450 reported searches across the remaining tested phrases. Ubersuggest labels much of its SEO Difficulty data as “Outdated,” so SD is used directionally, not as an exact current score.

Candidate comparison

Candidate	Observed demand	Competition fit	Commercial signal	Decision
Blechbiegen / Abkanttechnik	Too narrow for AdSense-first model	Attractive	Mixed	Do not lock
Regenwasser / Zisterne	Good	Moderate; stronger standards/public-sector overlap	Good	Strong backup
LKW Ladeplanung / Lademeter	Strongest of tested niches	Low-moderate with specialist competition	Strongest tested	LOCK

SERP evidence

The current result landscape contains both established logistics brands and smaller/specialist tool sites. Routix has a German pallet calculator that tests carton orientations and calculates layers and pallet counts. CARGOLO publishes pallet/LKW capacity calculators and closely related logistics

pages. Smaller or newer specialist pages also rank for questions around pallet capacity and truck loading. This means the niche is competitive, but it is not structurally closed to independent sites.

2. Locked launch tools

Launch with exactly four tools. They solve one workflow: “How much freight fits on a pallet or truck, and how much loading space does it consume?” This is narrow enough for topical authority and broad enough to support meaningful search demand.

1. Lademeter-Rechner

Primary SEO acquisition tool

Primary keyword set: Lademeter berechnen; Lademeter Rechner; Lademeter Europalette

Inputs: Cargo length, width, quantity, pallet/package type, stackability (where applicable)

Outputs: LDM, occupied floor area, m3, estimated trailer-space percentage, per-item and total results

Product requirement: Do more than expose a one-line formula. Support multiple cargo lines and practical presets so the result is useful enough to earn clicks even when Google shows the basic formula.

2. LKW-Palettenrechner

Truck / pallet capacity tool

Primary keyword set: wie viele Paletten passen in einen LKW; wie viele Europaletten passen in einen LKW; Palettenstellplätze berechnen

Inputs: Vehicle preset or custom internal dimensions, pallet format, orientation, quantity, optional stacking/weight

Outputs: Pallet positions, layout assumptions, remaining capacity, LDM equivalent and utilization

Product requirement: Use German/EU vehicle and pallet presets. Allow custom dimensions because real internal dimensions and body types vary.

3. Palettierungsrechner

Cartons-per-pallet optimizer

Primary keyword set: Palettenrechner; Kartons pro Palette berechnen; wie viele Kartons passen auf eine Palette

Inputs: Carton L/W/H, pallet type, max loaded height, max weight, total carton count, rotation allowed

Outputs: Cartons per layer, layers, cartons per pallet, pallet count, utilization and selected orientation

Product requirement: This should behave like a real geometry tool, not a static table. Test orientations and respect height/weight limits.

4. LKW-Beladungsrechner

Multi-item load-space planner

Primary keyword set: LKW Beladung berechnen; Ladevolumen berechnen; LKW Paletten Rechner

Inputs: Multiple cargo rows, dimensions, weights, quantities, pallet/package flags, vehicle preset

Outputs: Total LDM, m3, payload used, floor-space utilization, pallet positions and items that do not fit

Product requirement: This is the differentiator. It combines the smaller calculations into a practical planning workflow and gives the site a reason to be bookmarked.

Do not add at launch

Keep these outside the initial niche: freight-price calculators, customs/duty calculators, fuel-cost calculators, route planning, driving-time/tachograph calculators, VAT tools, general unit converters, shipment tracking and generic “all logistics calculators.” They dilute the single-topic site and introduce different SERPs, data dependencies and user intent.

3. Domain decision

Primary domain to lock: lademeter-rechner.de

- It directly communicates the strongest search/use case without needing explanation.
- The .de country-code fits the Germany-first strategy and German-language trust expectations.
- “Lademeter” is the central concept that connects truck space, pallets and load planning.
- The domain avoids the ambiguity of a generic “Ladeplaner” name, which can also refer to electric-vehicle charging planners.
- The hyphen improves readability for a long German compound; this is a branding/readability choice, not a claim that an exact-match domain guarantees rankings.

Availability rule

Before paying, check the exact .de registration status at DENIC or your registrar. Search engines did not surface an indexed site for the exact primary domain during this research, but that does not prove the domain is unregistered. DENIC states that its domain query is the authoritative way to check .de availability.

Fallback order if the primary is unavailable

1. lademeterrechner.de - Same meaning without the hyphen; still directly aligned to the main tool.

2. lkw-ladeplaner.de - Broader brand for truck load planning; “LKW” removes most charging-planner ambiguity.

3. lademeterpro.de - Shorter brand-style fallback that keeps the central keyword.

Do not change the niche just because the first-choice domain is unavailable. Use the fallback sequence above and keep the same topical architecture.

Recommended URL architecture

- **/lademeter-berechnen/** Main Lademeter calculator
- **/paletten-lkw-rechner/** Truck/pallet capacity
- **/palettenrechner/** Carton-to-pallet optimizer
- **/lkw-beladung-rechner/** Multi-item truck loading calculator
- **/ratgeber/...** Supporting German logistics guides only

4. Risks and the conditions of the lock

Zero-click risk on simple LDM math: The basic Lademeter formula is easy for snippets/AI to answer. The product must support multiple freight lines, presets and richer outputs so the page is useful beyond the formula.

Purpose-built competitors: Current competitors already offer pallet and loading tools. Win on German UX, speed, clear assumptions, useful defaults, examples and integrated workflow - not by publishing a thin calculator.

Real vehicle dimensions vary: Do not present one “standard truck” as universal. Use editable dimensions and clearly label presets/assumptions.

Weight and legal constraints: Physical fit does not automatically mean a legal/safe load. Separate geometric capacity from payload/axle/load-securing constraints and use clear disclaimers where needed.

Keyword-tool uncertainty: Ubersuggest volumes and SD are third-party estimates; SD was marked outdated in the supplied screenshots. The lock is based on combined evidence, not one metric.

Final locked scope

Country	Germany
Language	German
Domain	**lademeter-rechner.de (primary purchase target)**
Micro-niche	**LKW Ladeplanung, Lademeter & Palettenberechnung**
Launch tools	**4**
Monetization	Google AdSense initially

FINAL DECISION: LOCK THIS NICHE. The logistics/load-planning cluster is the strongest option validated in this research cycle. Register the primary domain if available (otherwise use the fallback order), and keep the initial product limited to the four tools above.
